

IN THE CLAIMS:

In accordance with the Revised Rules under 37 C.F.R. 1.121, please amend the claims as shown below and indicated as “currently amended.” Also shown below are claims that may be original, cancelled, withdrawn, previously presented, new, and not entered.

Please cancel withdrawn claims 5-11, 12-14, 31-33, and 37

1. (currently amended) A ribbon cartridge for a thermal transfer printer configured to provide a retractable feed for a donor ribbon, the ribbon cartridge comprising:

a housing;

a roll of donor ribbon wound on a hollow core within the housing;

a clutch operatively coupled to the core; and

a resilient structure frictionally coupled to an inner surface of the core ~~the clutch~~ and to the cartridge housing, and configured such that the release of energy stored in the resilient structure by advance of the donor ribbon produces retraction of ribbon slack if the donor ribbon is released or backfed.

2. (original) The ribbon cartridge of claim 1 wherein the clutch is formed of an elastomeric material.

3. (original) The ribbon cartridge of claim 1 wherein the resilient structure is formed of an elastomeric material.

4. (original) The ribbon cartridge of claim 1 wherein the clutch and the resilient structure are different portions of a common structure formed of an elastomeric material.

Claims 5-22 (cancelled)

23. (currently amended) A thermal transfer ribbon cartridge with self-contained clutching and slack take-up capability, comprising:

a cartridge housing;

a hollow core located within said housing and configured to receive a roll of ribbon;

a clutch located within said core and having a friction component configured to induce frictional engagement with said core, at least one end of the clutch adapted to be externally

constrained;

a resilient component located between said frictional component and said at least one end of the clutch; ~~and~~

a restraining structure external to said core, configured to receive and constrain said at least one end of the clutch; and

said resilient structure being configured such that torsional energy stored in the resilient component when the ribbon is withdrawn serves to retract slack when the ribbon is backfed.

24. (original) The ribbon cartridge defined by claim 23 wherein said restraining structure comprises part of said cartridge housing.

25. (original) The ribbon cartridge defined by claim 23 further including a support independent of said core and clutch, said support configured to support the weight of said core and roll.

26. (original) The ribbon cartridge defined by claim 25 wherein said support comprises part of said restraining structure.

27. (original) The ribbon cartridge defined by claim 23 wherein said friction component and said resilient component are parts of a common member.

28. (original) The ribbon cartridge defined by claim 27 wherein said common member comprises an elastomer.

29. (original) The ribbon cartridge defined by claim 28 wherein said elastomer is flat and comprises a center section configured to engage said core with an interference fit.

30. (original) The ribbon cartridge defined by claim 28 wherein said elastomer is flat and comprises an end section adapted to fit an external key to provide said constraint.

Claims 31-33 (cancelled)

34. (original) The cartridge defined by claim 23 wherein said roll is adapted to be rotatably supported on an externally mounted shaft.

35. (original) The cartridge defined by claim 27 wherein said roll is adapted to be rotatably supported on an externally mounted shaft, and wherein said common member has a longitudinal opening configured to receive said shaft.

Claims 36-48 (cancelled)
